

## \*Avastin and Use of an In-Line Filter\*

This article responds to your request for information on Avastin® (bevacizumab) and the use of in-line filters.

Avastin is formulated as a liquid concentrate for an infusion solution and does not require reconstitution.

There is no requirement to use an in-line filter during Avastin administration. Roche does not have recommendations for the use of an in-line filter when preparing or administering Avastin. The use of in-line filters may result in product hold-up.

During the manufacturing process, the Avastin bulk product is pre-filtered with sterile 0.22 micron filter.<sup>1</sup>
